

Power BI Data Import, Transformation and Data Modelling

Name: Hemavathi K

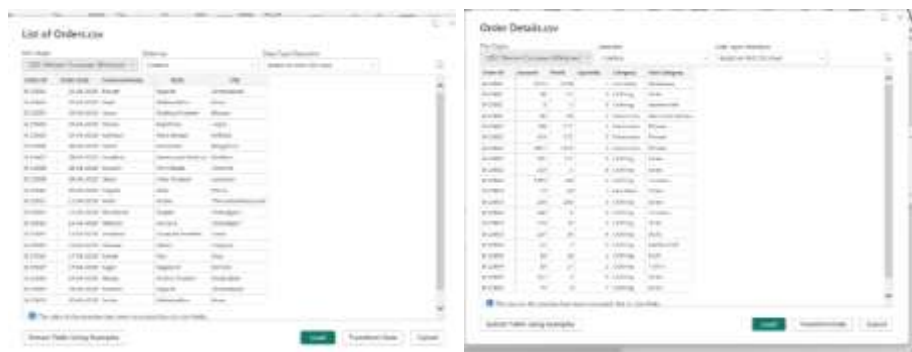

Course: Program In AI Driven Data Analytics

Batch: DA-FNB17

Date: 17-07-2026

Power Query Transformations

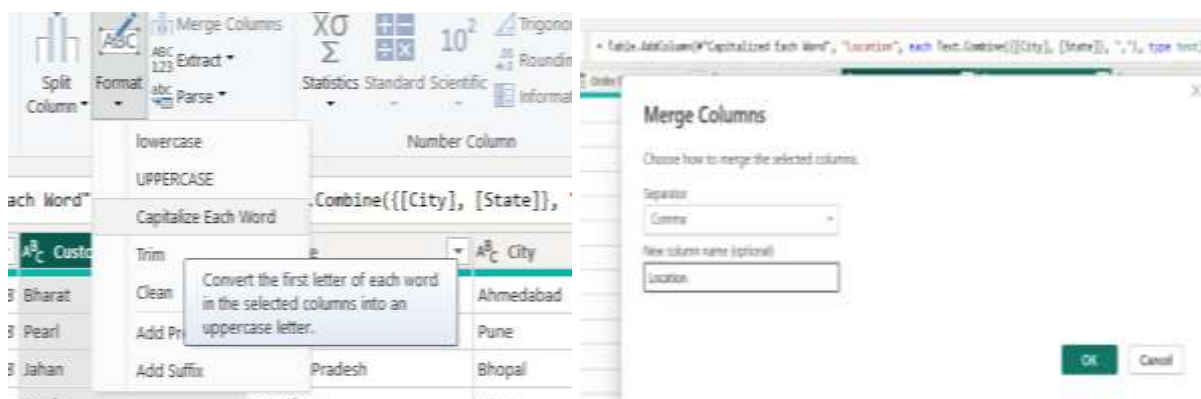

Imported three CSV datasets into Power Query

Restricted the List of Orders table to the first 500 rows, converted data types

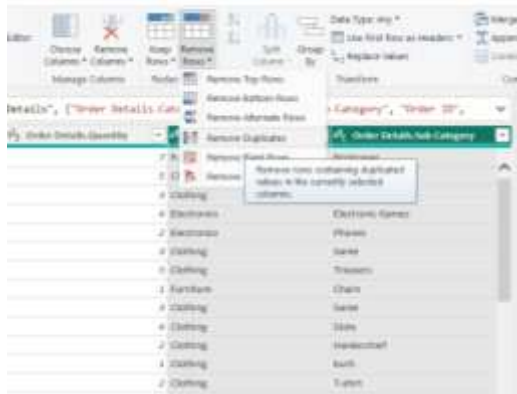

standardized Customer Name using Proper Case

added Profit Margin and Profit Status

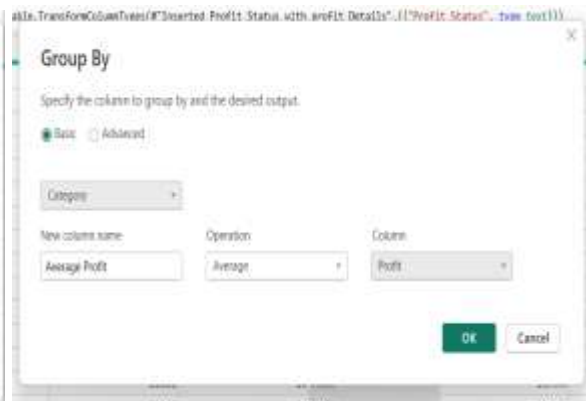

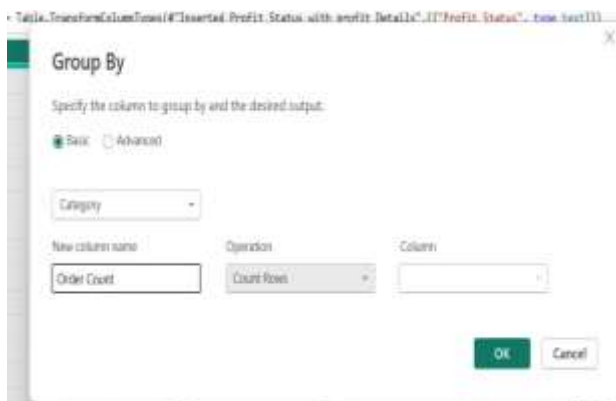

handled missing values and duplicates Selected the Required columns and removed the Duplicated rows based on Order Id , Order date, customer name, state, city, order details category, order details sub-category

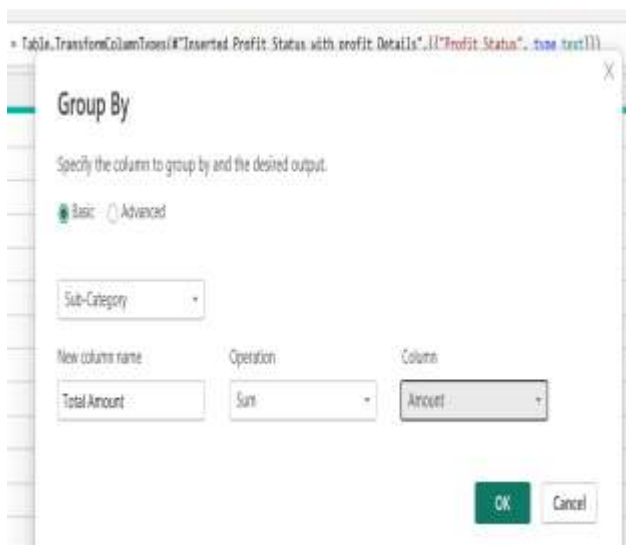

Grouping & Aggregation

Grouped the Order Details table to calculate the count of orders, average profit by category, and total amount by sub-category. Grouped the Sales Target table to calculate total target by month.

Total Amount Summary, Sales Target Summary

Data Model

Created a one-to-many relationship between List of Orders and Order Details using Order ID, and between Order Details and Sales Target using Category. Both relationships are active with a single cross-filter direction.
